September 7-10, 2014 St. Louis Union Station Hotel St. Louis, MO 2014

VOICE OF FOOD R

Rob Arthur, P.E., P Eng, LEED AP CTA Architects Engineers E+SO

- Question that was asked.
  - We would like to get a consultants perspective on the entire refrigeration system and design process. If you as the Refrigeration Engineer had no criteria, constraints, direction, etc. from the manufacturers or the client, what would your system design process be, what system(s) would you design, install, operate and maintain?

Energy & Store Development Conference 2014 E+SO
THE VOICE OF FOOD RETAIL

# **Refrigeration Design Process**

- Choices for doing a Refrigeration Design
   In House Engineering Team
  - Equipment Manufacturer
  - Consulting Engineer

– Any Others? (I can think of one more)

Energy & Store Development Conference 2014 E+SO
THE VOICE OF FOOD RETAIL

### **Refrigeration Design Process**

• Refrigeration Engineering Program

- Minor Program (Several Projects a Year)
  - Not large enough program to justify cost of Prototype Development
  - Utilize one source of design for consistent product or a couple of sources that communicate well
  - Use last project done as Criteria. Have some written standards

Energy & Store Development Conference 2014 E+SO THE VOICE OF FOOD RETAIL

- Refrigeration Engineering Program
  - Major Program (30+ Projects a Year)
    - Develop a Prototype and Criteria Update Process
      - Helps with coordination
      - Helps owner get what they want from multiple consultants
      - Cuts down on design costs
      - Reduces engineering time

E+SO

- Refrigeration Engineering Program
  - Advanced Refrigeration Design
    - Build time into schedule for full development
    - Bring all stake holders together
    - Utilize Refrigeration Consultant as hub that receives, distributes and coordinates with all stake holders.
      - Owner
      - Architect/Engineers
      - Equipment Manufacturer
      - Controls Manufacturer
      - Contractor

E+SC 2014 THE VOICE OF FOOD RETAIL

- Refrigeration Engineering Program
  - Equipment Selection
    - Best to know whose equipment you will be designing around from the beginning.
      - Space Planning
      - Electrical Loads
      - BTU Loads
      - Component Selection
    - Have Refrigerated Case specifications figured out
    - If equipment is bid after design expect some re-design

E+SC 2014 THE VOICE OF FOOD RETAIL

- Refrigeration Engineering Program
  - As Built Drawings
    - Require Consultant to provide final copy of latest design
      - Place Refrigeration Floor plan and Schedule on compressor room wall
      - Store Hard Copy of complete set of drawings in Compressor room in drawing tube
      - Develop storage process of Electronic CAD, DWF and PDF files in a usable format

Energy & Store Development Conference 2014 E+SO
THE VOICE OF FOOD RETAIL

### **Refrigeration System Selection**

• System with a Natural Refrigerant

Not an Environmentalist (but I do support improving the environment)

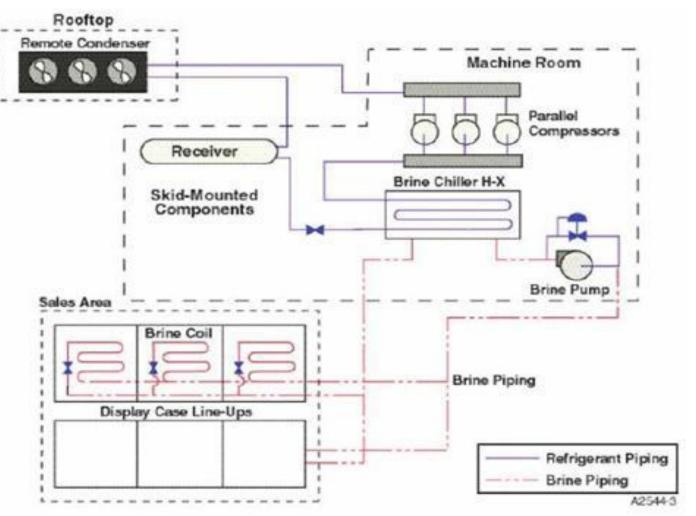

I am an Engineer and Businessman E+SC 2014 THE VOICE OF FOOD RETAIL

- Why a Natural Refrigerant
  - Lowest Life Cycle Costs.
  - No more major Refrigerant Conversions every 10 to 15 years.
  - Energy Efficiency (in the right application)
  - Environmental Benefits
  - Future Proofing
    - Phase Outs, De-Listing, Taxes, Fines, Charge Limits

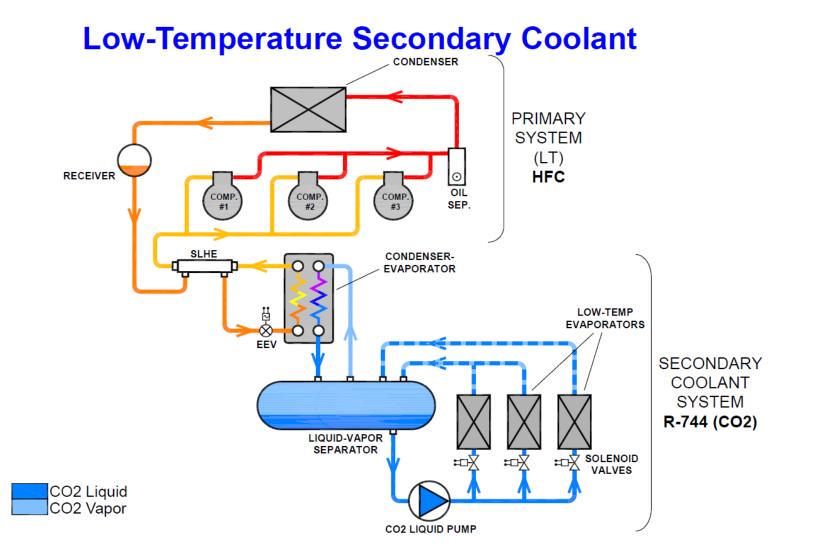

- Natural Refrigerants are:
  - CO2 (R-744)
  - Hydrocarbons (R-290, R-600, ect)
  - Ammonia (R-717)
  - Water (R-718)
  - Air (R-732)

Energy & Store Development Conference 2014 E+SO

### Summary

Don't believe Advanced systems of the future will look like current advanced refrigeration systems of today.

- •Standardized
- •Assembly Line
- •Modules
- •Off the shelf package units

Energy & Store Development Conference 2014 E+SC

### Summary

90% Natural Refrigerant Systems will use refrigerant with GWP near or below 500

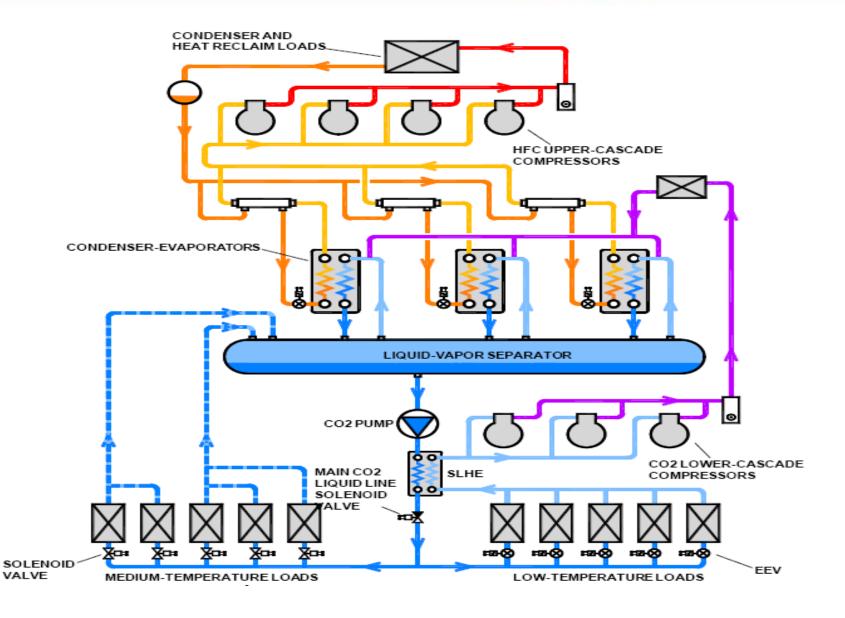

- •Low GWP won't be 1500 to 2000 (R-134a/R-407a)
- •Possibly

-A2L (R-32, L-40, DR-7, ARM-20, HDR-110 and others)

– HFO (HFO-1234yf, HFO-1234ze)

-New Refrigerants (R-448a, R-449a, ARM-32)

Energy & Store Development Conference 2014 E+SC

### Summary

CO2 as a Refrigerant is inexpensive and has a Really Low GWP (GWP=1)

- •Better Heat transfer than Glycol or Brine
- •Lower pump energy requirements than Glycol or Brine
- •CO2 Systems have Smaller Pipe size requirements than Glycol, Brine or DX systems
- •CO2 Systems can be energy neutral or better then traditional DX systems

Energy & Store Development Conference 2014 E+SO

### Summary

For End Users Having an Aggressive Energy and Sustainability Goals

- •CO2 Transcritical (where feasible)
- •Ammonia/CO2 Cascade
- Micro Distributed
- •A2L/CO2 Cascade (with SNAP and UL approvals)

### Summary

 System Types this Refrigeration Consultant would choose if the selection was solely up to me

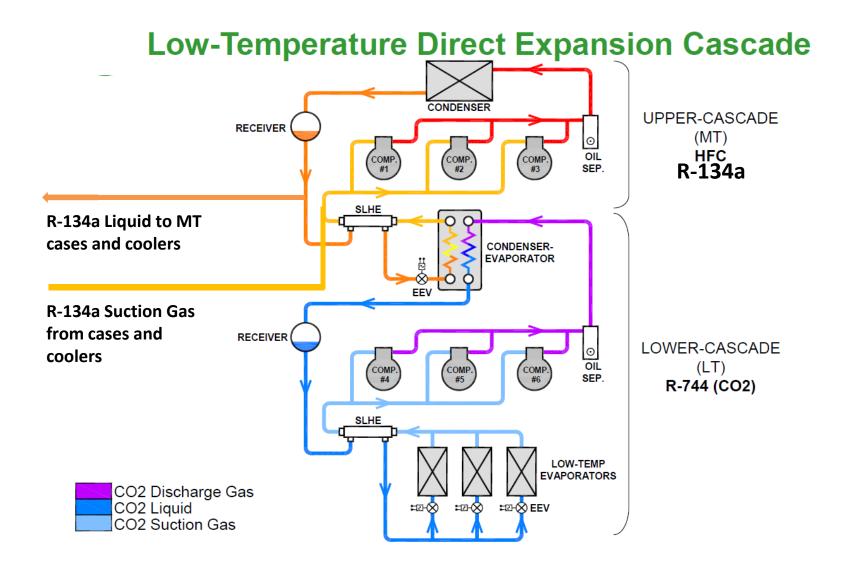

Energy & Store Development Conference 2014 E+SO

### Summary

- 40% Natural Refrigerant Solution
  - R-134a Hybrid System
    - R-134a Medium Temp System
    - Low Temperature CO2 Cascade DX
  - Benefits over Industry Standard R-407a system
    - Lower Energy Use
    - Lower Life Cycle Cost
    - Lower TEWI value

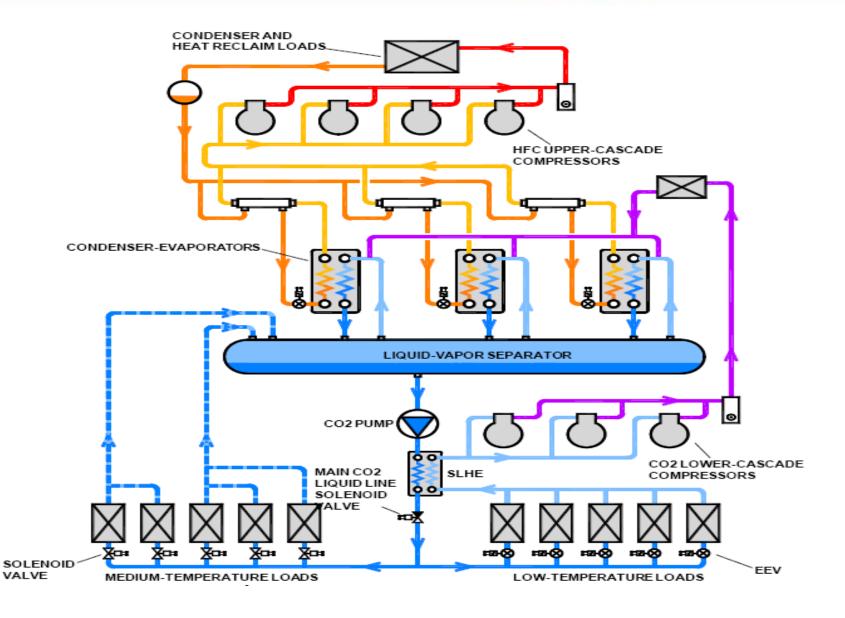

### Summary

- 90% Natural Refrigerant Solution
  - Low Charge HFC System
    - R-134a chiller
    - Medium Temperature CO2 Secondary
    - Low Temperature CO2 Cascade DX
  - Benefits over Industry Standard R-407a system
    - Lower Energy Use
    - Lower Life Cycle Cost
    - Lower TEWI value

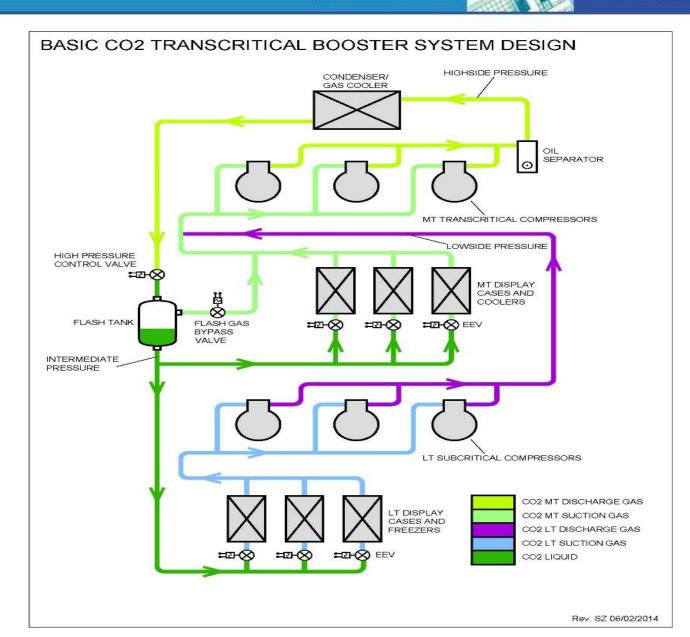

Energy & Store Development Conference 2014 E+SC

### Summary

- 100% Natural Refrigeration System
  - CO2 Transcritical or Enhanced Transcritical
    - Where annual ambient temperatures are such that there is an energy benefit
  - Benefits over Industry Standard R-407a system
    - Lower Energy Use (in the right application)
    - Lower Life Cycle Cost
    - Very low TEWI value

Energy & Store Development Conference 2014 E+SO

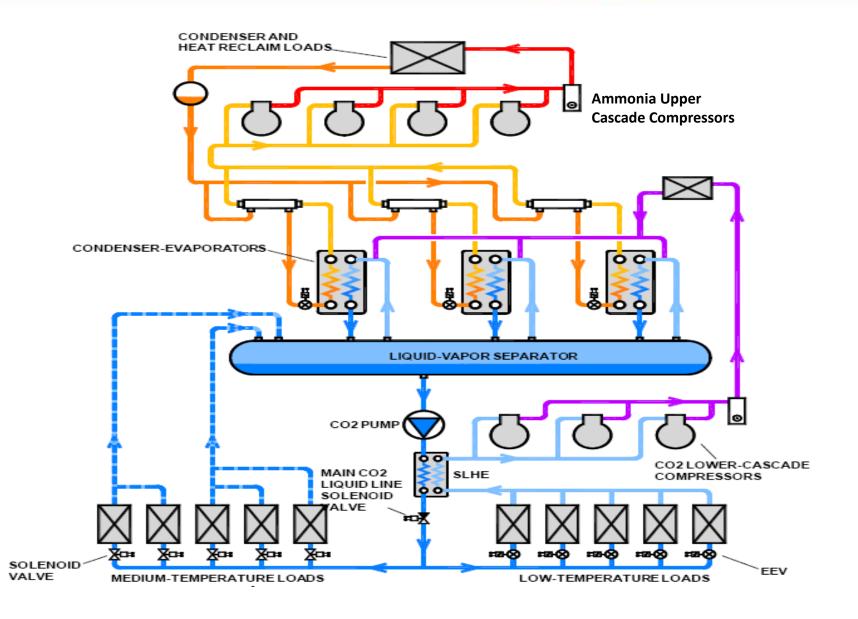

### Summary

- 100% Natural Refrigeration System
  - Ammonia System
    - Ammonia Chiller
    - Medium Temperature CO2 Secondary
    - Low Temperature CO2 Cascade DX
  - Benefits over Industry Standard R-407a system
    - Lower Energy Use
    - Lower Life Cycle Cost (Changes when CO2 cost something)
    - Lowest possible TEWI value
